Jackson, WY

Highways, roads, and streets link our society and underpin our economic health. This is particularly true in a large-area, low population state like Wyoming and the other Rocky Mountain states.

Nelson Engineering has an extensive history of planning, designing, permitting, and administering the construction of highway, road, and street projects. Our experience with projects for numerous Wyoming counties and municipalities, the Wyoming Department of Transportation, the U.S. Forest Service, and private developers has given us a clear perspective on road projects of all sizes and complexity. Our experience in all phases of these projects gives clients the confidence that we can complete all aspects of a multi-disciplinary project.

Nelson Engineering designs transportation corridors that serve motorized and non-motorized use. Roadways often serve as utility corridors—we also efficiently incorporate water, sewer, storm drainage, and other infrastructure into roadway design. Our field engineering experience and understanding of the construction process contributes to cost-effective design outcomes.

Our aim is to obtain a clear understanding of scope of a project and plan for its functional use far into the future. The personnel at Nelson Engineering do not hesitate to work interactively with clients and the landowners affected by a roadway/street improvement project. The interaction continues through the construction phase.
